Informazioni dell'espositore

ALPEGO is a young company with a long experience, started in 1990 by the brothers Giovanni and Luciano Pegoraro. From the very beginning the purposes and the character of the founders became obvious: to design and build a large range of farm implements meant to satisfy the most demanding professional customers. In terms of years, Alpego may appear as one of the youngest companies manufacturing implements to work the soil and to seed, but their staff have accumulated an experience of several years of work done in close contact with farmers and this constant cooperation has directly contributed to the development of a very high technological level in this branch.

Description of the activities

The ALPEGO Company is located in the Venitian region, at the border between the Provinces of Vicenza and Verona. This area is characterized by a large number of small and medium-sized, often family-owned manufacturing companies, who operate in the most varied branches and who often obtain brilliant results which have made them famous world-wide.

This is the setting where the Alpego Company was born and with the help of a staff rich with an experience of several dozens of working years, they have designed a wide range of farm implements which can satisfy the most demanding professional customers, thereby vastly contributing to the development of farm mechanization. By adopting state-of-the-art technology, they are able to bring to the market highly reliable and very sturdy implements. Their goal is that of constantly improving and innovating their machines.

Alpego are always aware of the demands of their most specialized customers, who range from Northern to Southern Europe, from the Eastern to the Mediterranean Countries, such as Greece and Spain, where there are large farming companies, where it is adamant to greatly reduce working time by combining the soil preparation with the seeding phases.

Their production range includes:

A – **implements** for the in-depth breaking up of the soil, for the **speedy and coarse opening of the soil** which so well replaces the ploughing operation for the first important labouring of the soil.

B – **implements for the preparation of the seed-bed**, such as power harrows having working dimensions which reach 8 meters and which can be folded for the purpose of transportation on public roads so that their width easily comply with the legally admissible width (2.5meters).

C – **combined implements for the preparation of the seed-bed and seed drilling**: these implements perform two simultaneous operations in one passage: the very fine crumbling of the soil and the seed-drill operation with a state-of-the-art pneumatic system

D – **flail and verge mowers**: dynamic implements which can follow the contours of the land, even on slanted surfaces, such as banks and steep inclines for the mulching of vegetables, from weeds with a small diameter stem up to plants with wooden stems, always granting a perfect mulching of the rests.
